

What did real waiver bids tell us?

A replay of production strategies plus analysis-only Middle VORP and corrected PR #13 curves against 239 anonymized bids from SeaMex 2026. Useful signal, but not enough stable evidence to crown a default.

Evidence window

Reconstructed decision weeks W2 and W3

Data through

2026-09-25T23:00:08.539Z

Scope

One 32-team league · \$500 FAAB

Five-bullet answer

- Scope: W2 and W3 have same-week reconstructed snapshots. The top three are unique canonical winners after owner-directed-outlier-01 (private GET-only catalog match plus exact position/total fingerprints in both reconstructed snapshots map uniquely to one canonical completed W3 win at \$234; proof matches=1); the closest overall serious-median strategy is Current-team VoRP.
- W2 top-three winning-price arithmetic multipliers (observed/intrinsic): Max VORP 3.34× (3/3); Middle VORP 5.19× (3/3); Current-team VoRP 3.38× (3/3); Corrected Safe 2.30× (3/3); Corrected Weeks as Starter 2.84× (3/3).
- W3 top-three winning-price arithmetic multipliers (observed/intrinsic): Max VORP 2.35× (3/3); Middle VORP 3.00× (3/3); Current-team VoRP 3.00× (3/3); Corrected Safe 1.94× (3/3); Corrected Weeks as Starter 1.94× (3/3).
- W2 top-three serious-market-median arithmetic multipliers: Max VORP 1.40× (3/3); Middle VORP 2.21× (3/3); Current-team VoRP 1.42× (3/3); Corrected Safe 0.92× (3/3); Corrected Weeks as Starter 1.14× (3/3); closest across all W2 eligible market clusters: Max VORP.
- W3 top-three serious-market-median arithmetic multipliers: Max VORP 0.78× (3/3); Middle VORP 1.02× (3/3); Current-team VoRP 1.00× (3/3); Corrected Safe 0.65× (3/3); Corrected Weeks as Starter 0.65× (3/3); closest across all W3 eligible market clusters: Current-team VoRP.

Scope guardrail

Only W2 and W3 have like-for-like same-week reconstructed snapshots. W4 is explained as missing rather than backfilled. Aggressive is omitted here because it is derived from Safe.

CLOSEST MEDIAN MARKET

Current-team VoRP

Lowest MAE across owner-directed player/week clusters; competing claims stay within the canonical winner's processing batch.

STRATEGY × SCALE

Separate them

Intrinsic formulas describe target shape; observed/intrinsic multipliers estimate weekly market scale.

PRODUCT DECISION

Hold

Two reconstructed weeks do not support manager-style claims or a production default change.

Middle VORP stays analysis-only.

One shared horizon: $\text{targetTeams} = \max(4, \text{ceil}(\text{teamsRemaining} / 2))$. At the latest reproducible W3 state, 28 teams map to 14. It never maximizes a different stage per player.

Recommendation: retain analysis-only

- Conceptually cleaner than per-player Max VORP stage selection.
- Only W2/W3 are evaluable and both projection snapshots are reconstructed.
- W4+ exact pre-waiver captures must confirm held-out error, bias, rank quality, and 33%/50%/67% stability before any default review.

Privacy-safe current input

W3, 1142 stored rows / 445 supported QB/RB/WR/TE players, hash 0aea608679cb52d1...; aliases only, no league/manager identity or raw payload.

Current-state dollar distributions

Full supported QB/RB/WR/TE projection population; positive counts make each method's support explicit.

Middle vs 67% horizon	33%	10	65	\$6.3
Middle vs 33% horizon				

Historical common-horizon sensitivity				
Canonical winning bids, owner-directed exclusion applied; floor and ceil are identical because observed W2/W3 team counts are even.				
HORIZON	N	MAE	BIAS	P
67%	13	71.4	-68.5	0.693
50% ceil	9	95.3	-94.7	0.711
50% floor	9	95.3	-94.7	0.711
33%	8	106.0	-106.0	0.714

Shape is not scale.

Important metric label

Every value labeled **raw prediction R²*** keeps strategy dollar predictions fixed on the identity line. It is not the goodness-of-fit R² from a regression trained on these bids. Negative values are valid and mean the fixed predictions lose to the observed-mean baseline—not that correlation is negative.

Top-three canonical winners and serious market medians use observed bid ÷ intrinsic same-week suggestion. Arithmetic mean is primary; geometric mean, median, and coverage expose ratio skew and zero denominators.

Compact with-vs-without sensitivity

private GET-only catalog match plus exact position/total fingerprints in both reconstructed snapshots map uniquely to one canonical completed W3 win at \$234; marker only, with no private identity stored.

View	Clusters	Closest	Max VORP MAE	Middle VORP MAE	Current-team VORP MAE	Corrected Safe MAE	Corrected Weeks as Starter MAE
Owner-directed exclusion	28	Current-team VoRP	\$12.5	\$20.8	\$11.0	\$21.7	\$17.8
Raw evidence retained	29	Current-team VoRP	\$12.5	\$20.8	\$11.1	\$20.8	\$17.9

Interpretation boundary

The owner-directed marker is excluded only from this labeled analysis; raw canonical evidence remains in the sensitivity row. Serious means bid > \$5, failed claims must be legitimate same-target competitors, and FAAB-limited observations are marked censored. This supports a strategy-shape × market-scale hypothesis, not individual manager-style conclusions from two reconstructed weeks.

Price fit depends on the question.

Winning-bid error asks who best estimates the clearing price. All-bid error also includes failed claims and token bids. Lower MAE is better; bias shows direction.

Winning-bid scorecard

n=47; subset=usable winning bids • Reconstructed W2-W3 projection snapshots • transaction-ledger FAAB • anonymized fixture v1

Sensitivity stays explicit across filters.

These filters were declared before inspecting winners and applied independently. They are sensitivity checks, not permission to delete inconvenient evidence.

Token threshold

Low intent means bid $\leq \max(\$1, 1\% \text{ of original FAAB}) = \5 . Tokens remain in the all-bid view and are separated here.

Three outlier lenses

Ratio-gap flagged 1 isolated top; MAD flagged 3; IQR flagged 4. Independent robust rules test whether one extreme drives the conclusion.

Honest conclusion

Corrected Safe (PR #13) is the sample winner. Corrected Safe (PR #13) also leads all three predeclared robust filters. Treat this as descriptive evidence, not a default-setting result.

Identity lines expose the misses.

Each dot is an anonymized winning target. A perfect forecast lies on the dashed diagonal; below it underpredicts. Extreme observed bids stretch beyond every intrinsic strategy; Aggressive reaches higher than the others, but still underpredicts the largest win.

EVIDENCE VIEW

Actual vs. predicted: where errors happen

n=47 winning bids per strategy • reconstructed W2-W3 • anonymized targets

* Prediction R^2 is scored against the identity line with no regression refit. It is not fitted-regression R^2 and may be negative.

Manager-adjusted walk-forward forecasts

n=133 all forecastable / n=27 wins • strict prior-batch subset • Reconstructed W2-W3 projection snapshots • transaction-ledger FAAB • anonymized fixture v1
Separate subset: 106 of 239 usable bids lacked sufficient prior-only manager evidence.

Manager-adjusted subset

Strict prior-batch walk-forward • Reconstructed W2-W3 projection snapshots • transaction-ledger FAAB • anonymized fixture v1 • smaller, non-comparable subset

FORECAST SUBSET	N	MAE	MEDIAN AE	BIAS	SPEARMAN P	PREDICTION R^{2*}	WITHIN TOLERANCE
All forecastable bids	133	28.0	18.0	+12.1	0.67	-0.07	31.6%
Forecastable wins	27	22.9	6.0	-19.9	0.76	0.46	51.9%

Measures, assumptions, and guardrails.

All formulas are evaluated on dollars unless marked normalized. Predictions are intrinsic strategy values; manager forecasts are capped at reconstructed pre-bid FAAB.

MAE MAE = (1/n) Σ predicted – actual Average dollar miss. Easy to interpret; extreme bids still matter.	Median absolute error Median AE = median(predicted – actual) The typical dollar miss; less sensitive to a small number of extremes.	Signed bias Bias = (1/n) Σ (predicted – actual) Negative means systematic underprediction; positive means overprediction.
Spearman rank correlation ρ = Pearson correlation(rank(actual), rank(predicted)) Tests whether expensive targets rank above cheap ones. Ties receive average ranks.	Prediction R² (unfitted) R² = 1 – SSE / SST This is the standard predictive score against the observed-mean baseline, but not fitted-regression R². Strategy dollars remain fixed on the identity line. A negative value means they are worse than predicting the observed mean; it does not mean negative correlation.	Normalized FAAB error mean(predicted/FAAB – actual/FAAB) Reported against original \$500 and reconstructed pre-bid manager FAAB. It compares budget share, not willingness.
Cluster-bootstrap interval 2,000 resamples of player × processing-batch clusters Fixed seed 20260927; percentile 2.5%–97.5%. Keeps correlated win/loss claims together. It does not repair snapshot-history error.	Coverage predicted ∈ [lowest serious loss, winning bid] Computed on 19 competitive player/batch clusters. It asks whether a strategy falls inside observed serious bidding range.	Outlier rules ratio ≥ 2× + \$50 gap; MAD > median + 3×1.4826×MAD; IQR > Q3 + 1.5×IQR MAD/IQR also require a \$25 gap; minimum cluster sizes are 3 and 4. Flags are independent and never silently deleted.
Within tolerance predicted – actual ≤ max(\$5, 20% of actual) A practical accuracy band shown alongside continuous error measures.		

Provenance boundary

All 239 formula-usable events use same-week reconstructed W2/W3 projection snapshots and transaction-ledger FAAB reconstruction. Reconstructed means captured after the canonical cutoff; it is not proof of what managers saw. W4 was excluded because only an earlier-week fallback existed. No identities, league identifier, player names/IDs, manager names/IDs, raw payload, or credentials appear in this artifact. Regenerate deterministically with `npm run analyze:bidding:presentation`.
